One of the key areas of any radio system is that part where the signal is transferred from the transmitter to the receiver. This involves the use of antennas or aerials to radiate the signal as an electromagnetic wave, and then there is the way that the electromagnetic wave travels or propagates between the transmitting antenna and the receiving one. Thus antennas and propagation are key areas for any radio system.

Types of Antennas
Isotropic antenna (idealized) oRadiates power equally in all directions
Dipole antennas oHalf-wave dipole antenna (or Hertz antenna) oQuarter-wave vertical antenna (or Marconi antenna)
Parabolic Reflective Antenna oUsed for terrestrial microwave and satellite applications oLarger the diameter, the more tightly directional is the

In order to assess the usability of wireless communication with medical im- plants, we have investigated the design of implantable antennas to be used in the body. Both theoretical limits and practical designs of the antennas are de- scribed. The SAR levels of the implanted antennas have been calculated and have been found to be at a safe level.
