The Cell Cycle, Mitosis and Meiosis The cell cycle Actively dividing eukaryote cells pass through a series of stages known collectively as the cell cycle : two gap phases (G1 and G2); an S (for synthesis) phase, in which the genetic material is duplicated; and an M phase, in which mitosis partitions the genetic material and the cell divides.

Cell Reproduction, Mitosis, and Meiosis Vocab Flashcards ...

Mitosis is more common than meiosis and has a wider variety of functions. Meiosis has a narrow but significant purpose: assisting sexual reproduction. In mitosis, a cell makes an exact clone of itself. This process is what is behind the growth of children into adults, the healing of cuts and bruises, and even the regrowth of skin, limbs, and appendages in animals like geckos and lizards.

Mitosis maintains the cell's original ploidy level (for example, one diploid $2n$ cell producing two diploid $2n$ cells; one haploid n cell producing two haploid n cells; etc.). Meiosis, on the other hand, reduces the number of sets of chromosomes by half, so that when gametic recombination (fertilization) occurs the ploidy of the parents will be ...
