The history of anatomy extends from the earliest examinations of sacrificial victims to the sophisticated analyses of the body performed by modern scientists. The study of human anatomy can be traced back thousands of years, at least to the Egyptians, but the science of anatomy, as we know it today, did not develop until far later. The development of the study of anatomy gradually built upon ...

The synovial membrane (also known as the synovial stratum, synovium or stratum synoviale) is a specialized connective tissue that lines the inner surface of capsules of synovial joints and tendon sheath. It makes direct contact with the fibrous membrane on the outside surface and with the synovial fluid lubricant on the inside surface. In contact with the synovial fluid at the tissue surface ...

bruises A bruise is generally understood to mean an area of haemorrhage caused by the leakage of blood from ruptured vessels (including capillaries, but predominantly veins, venules and small arterioles) - into surrounding (perivascular) tissues, following a 'blow'.. The picture above is of a bruise with a mixture of colours, which is diffusing at the yellowing edges, indicating that this was ...

Only primates have temporal lobes, which are largest in man, accommodating 17% of the cerebral cortex and including areas with auditory, olfactory, vestibular, visual and linguistic functions. The hippocampal formation, on the medial side of the lobe, includes the parahippocampal gyrus, subiculum, hippocampus, dentate gyrus, and associated white matter, notably the fimbria, whose fibres ...

The trapezius muscle is a large, paired, triangular shaped muscle located superficially in the back of the neck and thorax. When viewed together, the two trapezius muscles together roughly form a diamond or trapezoid shape, responsible for the trapezius name. Trapezius is one of the superficial posterior axioappendicular, or extrinsic muscle pairs.

The temporal bones are a pair of bilateral, symmetrical bones that constitute a large portion of the lateral wall and base of the skull. They are highly irregular bones with extensive muscular attachments and articulations with surrounding bones. There are a number of openings and canals in the temporal bone through which structures enter and exit the cranial cavity.
