The purpose of this chapter is to illustrate the basic principles underlying the current standard methods to accurately solve Eq. (1.3), which represents the main task for the ab initio calculations of the electronic structure in real poly-atomic systems. The different schemes to achieve this goal can be classified into two main categories: the wave function-based methods, traditionally known ...

A model potential-energy function comprising both two- and three-atom contributions is proposed to describe interactions in solid and liquid forms of Si. Implications of this potential are then explored by molecular-dynamics computer simulation, using 216 atoms with periodic boundary conditions. Starting with the diamond-structure crystal at low temperature, heating causes spontaneous ...
