Classical mechanics describes the motion of macroscopic objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars and galaxies.. If the present state of an object is known it is possible to predict by the laws of classical mechanics how it will move in the future (determinism) and how it has moved in the past (reversibility).

In physics and engineering, fluid dynamics is a subdiscipline of fluid mechanics that describes the flow of fluids—liquids and gases.It has several subdisciplines, including aerodynamics (the study of air and other gases in motion) and hydrodynamics (the study of liquids in motion). Fluid dynamics has a wide range of applications, including calculating forces and moments on aircraft ...

The aim of this module is to consolidate and build on the ideas and skills introduced in the first year of engineering mechanics module. Students will be able to carry out strength and deflection analyses for a variety of simple load cases and structures, will understand the simplifications used in such analyses and appreciate the role of stress analysis and failure prediction in the design ...
