How Gear Ratios Work. You just count the number of teeth in the two gears and divide. So if one gear has 60 teeth and another has 20, the gear ratio when these two gears are connected together is 3:1. They make it so that slight imperfections in the actual diameter and circumference of two gears don't matter.

How Gear Ratios Work. In this figure, the diameter of the gear on the left is twice that of the gear on the right. The gear ratio is therefore 2:1 (pronounced "two to one"). If you watch the figure you can see the ratio: Every time the larger gear goes around once, the smaller gear goes around twice.

### **Gearing Ratio Definition - Investopedia**

A gearing ratio is a type of financial ratio that compares company debt relative to different financial metrics, such as total equity. Investors sometimes use these types of ratios to assess how well a company can survive an economic downturn. Gearing represents a company's leverage, meaning how much of the business funding comes from creditors (debt holders) versus company owners (stockholders).

In Year 1, ABC International has \$5,000,000 of debt and \$2,500,000 of shareholders' equity, which is a very high 200% gearing ratio. In Year 2, ABC sells more stock in a public offering, resulting in a much higher equity base of \$10,000,000.

The general rule is -small to large gear means 'divide' the velocity ratio(3:1) by the rpm of the first gear. Divide 75 teeth by 25 teeth to find the velocity ratio. divide the 60rpm by the velocity ration (3). The answer is 20rpm.

Two Gears. In our example, dividing the 30 teeth of the driven gear by the 20 teeth of the drive gear gets us  $30/20 = 1.5$ . We can also write this as  $3/2$  or  $1.5 : 1$ , etc. What this gear ratio means is that the smaller driver gear must turn one and a half times to get the larger driven gear to make one complete turn.

Gear ratios are what engineers call "torque multipliers." Higher numbers give more torque more quickly to allow better acceleration. Let's compare that to, say, an early 1960s Ford truck transmission, with fourth gear at a 1:1 ratio, third at 1.69:1, second at 3.09:1 and first at a very short 6.32:1.

### **How Does Gear Ratio Affect Mileage and Performance?**

Example. The input gear in this gear train has 13 teeth and the idler gear has 21 teeth. Considering only these gears, the gear ratio between the idler and the input gear can be calculated as if the idler gear was the output gear. Therefore, the gear ratio is driven/drive =  $21/13 \approx 1.62$  or 1.62:1. At this ratio,...
