Putting It Together: Set Theory and Logic. George Boole. In this module we've seen how logic and valid arguments can be formalized using mathematical notation and a few basic rules. In fact when George Boole (1815-1864) first developed symbolic logic(or Boolean logic), he had the idea that his system could be used by lawyers, philosophers, and mathematicians alike to help put convoluted arguments on a firmer footing.

logic. This is necessary as we need tools from set theory to study formal logic, while we also want to de ne set theory within the framework of formal logic. One is not allowed to complain that this involves circular reasoning. As part of the course, we will also side-track to learn about well-orderings and partial orders, as these are very useful tools in the study of logic and set theory.

For our purposes, it will suffice to approach basic logical concepts informally. That is, we adopt a naive point of view regarding set theory and assume that the meaning of

purposes, a set is a collection of objects or symbols. The objects in a set will be called elements of the set. Sets are usually described using "fg" and inside these curly brackets a list of the elements or a description of the elements of the set. If ais an element of a set A, we use the notation a2Aand often say "ain A" instead of "aan element of A".

dents with a little background in logic, and some high school mathematics. It aims to scratch the tip of the surface of the phi-losophy of set theory. By the end of this book, students reading it might have a sense of: 1.why set theory came about: 2.how to reduce large swathes of mathematics to set theory + arithmetic:

Set theory - Set theory - Operations on sets: The symbol ∪ is employed to denote the union of two sets. Thus, the set A ∪ B—read "A union B" or "the union of A and B"—is defined as the set that consists of all elements belonging to either set A or set B (or both). For example, suppose that Committee A, consisting of the 5 members Jones, Blanshard, Nelson, Smith, and Hixon ...

There is a natural relationship between sets and logic. \$A\$ is a set, then \$P(x)=\$"\$x\in A\$"" is a formula. It is true for elements of \$A\$ and false for elements outside of \$A\$. Conversely, if we are given a formula \$Q(x)\$, we can form the truth
