Digestion is the breakdown of large insoluble food molecules into small water-soluble food molecules so that they can be absorbed into the watery blood plasma. In certain organisms, these smaller substances are absorbed through the small intestine into the blood stream. Digestion is a form of catabolism that is often divided into two processes based on how food is broken down: mechanical and ...

The gastrointestinal tract (digestive tract, digestional tract, GI tract, GIT, gut, or alimentary canal) is an organ system within humans and other animals which takes in food, digests it to extract and absorb energy and nutrients, and expels the remaining waste as feces. The mouth, esophagus, stomach and intestines are part of the gastrointestinal tract.

A simple technique for the determination in vitro of the dry- or organic-matter digestibility of small (0.5 g) samples of dried forages is described. It involves incubation first with rumen liquor and then with acid pepsin. Using 146 samples of grass, clover and lucerne of known in vivo digestibility (Y), the regression equation $Y = 0.99 X - 1.01$ (S.E. ± 2.31) has been calculated ...

The science of animal nutrition as practiced at ETH Zurich has its main emphasis on livestock nutrition (cattle, sheep, poultry, and camels). Animal nutrition includes elements of feed science, nutrition physiology, assessment of the quality of primary foods (milk, meat, egg) and the generation of noxious emissions of methane and nitrogen from livestock husbandry.

Equines are faced with digestive disorders derived from abrupt feed changes from mainly forages to high-starch cereal grains. This diet change aimed at meeting the nutritional requirements to optimize the horse's performance causes microbial imbalances in the gut, which results in unintended but inevitable health problems such as colic, diarrhea, gastric ulcer, and laminitis.
